

MIRRORIMAGE

On The Planet Aerathea, the people find themselves in a middle of a war to end all wars 2 factions wage, of might, magic, technology, space, nuclear, chemical, and biological warfare across an already war-ravaged world for thousands of years. The empire Vrag, who is ruled by a rouge AI shadow government seeks total control and dominance over the whole world, while the United Democratic Countries UDC an alliance of men, elves and the remains of many other broken factions from the old wars fight to oppose this oppressive threat to freedom and liberty, you are a among the elite in the cybernetic enhancement program known as the Pilot program joining the ranks in the 3rd generation pilots, cybernetically enhanced soldiers armed to the teeth and aided by a Human Augmented Intelligence you can fight for freedom, aid in tieriney, or to the highest bidder, the choice is yours.

THE OBJECTIVE

In this game you are fighting against the clock and your opponent to reach a victory and survive on the battlefield with limited resources. The goal therefore of the game is to defeat your opponent before you run out of resources; by reducing your opponent's life to 0, or before you run out of resources in your stockpile at the start of your turn.

HOW TO WIN

To win the game with you will have the opportunity to put together a deck of cards consisting of your pilot, augments, entities and cyberspells, to dish out damage enable drastic maneuvers to stay alive and generate the resources you will need to play the cards in your hand.

The most straight forward way to victory is to reduce your opponent's life points to 0 by attacking with units (a type of entity) strikes (a type of cyberspell) or weapons (a type of entity).

Another way to win is to run your opponents out of cards in their deck, which doesn't end the game but each card they draw from a deck of 0 cards causes them to lose 1 life or concede. The final way to win the game is if your opponent starts with 0 resources in their stockpile zone at the start of their turn.

PLAYMAT AREA

BATTLEFIELD: Is the battlefield zone, where all your Entities go when they are played from anywhere, the only exception is if you used *Time counters* to pay for part of its casting cost, in which case you would put that many time counters on the card and it goes into the stockpile, then once all the time counters are gone it would then go to the battlefield.

STOCKPILE: Is the Stockpile zone, where all your Resources are stored for you to use, to use a recourse, turn it from vertical 90 degrees to horizontal 90 degrees (this is represented by the  symbol) expending as its call a resource in this way adds a color of that resource to pay for costs of cards and abilities. Cards you play with using time counters also go in the stockpile zone.

IN PLAY: Is a reference to both the *Battlefield* and *stockpile*, anything that effects *In Play* affect both these zones.

PILOT: The *Pilot* zone is where you put your pilot card, you may play your pilot from this zone by paying its cost. Whenever your pilot is defeated or moves from one zone to another you may instead put it back into your pilot zone and increase its cost by 2

RIG: Is the RIG zone, where you place your Deck face down and shuffled before the game starts. Your Deck is called your RIG which stands for Regressive Integrated Gear, which filled with the Entities and Cyberspell Cards you put together to create your deck.

TRASHYARD: Is the Trashyard zone, aka the discard pile, where all cards go that leave play by an assortment of effects or abilities, some include when a unit is defeated, or you complete the effect of playing a cyberspell.

DISMANTLED: Is the Dismantled zone, where cards that are removed from the game and go when they can no longer be used until the game ends. It functions like a separate discard pile; wherever you choose that is not part of the main areas listed above. whenever you gain a resource card to go to your stockpile you can gain one from the dismantled zone, like wise for creating tokens, which resources are.

READING YOUR CARDS

! Important ! : If There's a conflict between a card's text and this rules book follow the text on the card. Often Cards have abilities that get around rules to make things exciting, weird or interesting.

CARD NAME

INVOKE COST:
Expend Resources equal to the cost sorted by colour, any grey numerical cost is 1 of any resource colour or can use time to reduce that generic cost by 1, for each time counter you put on the card.

THREAT LEVEL: 
This is both the damage this unit deals and how much damage it can take before becoming defeated and going to the discard pile.

EFFECTS AND ABILITIES:
This Box shows Keyword static abilities Effects and Triggered Keyword like the Enters play, and lastly italic flavour text

CARD NUMBER

ARTIST & AI Credit

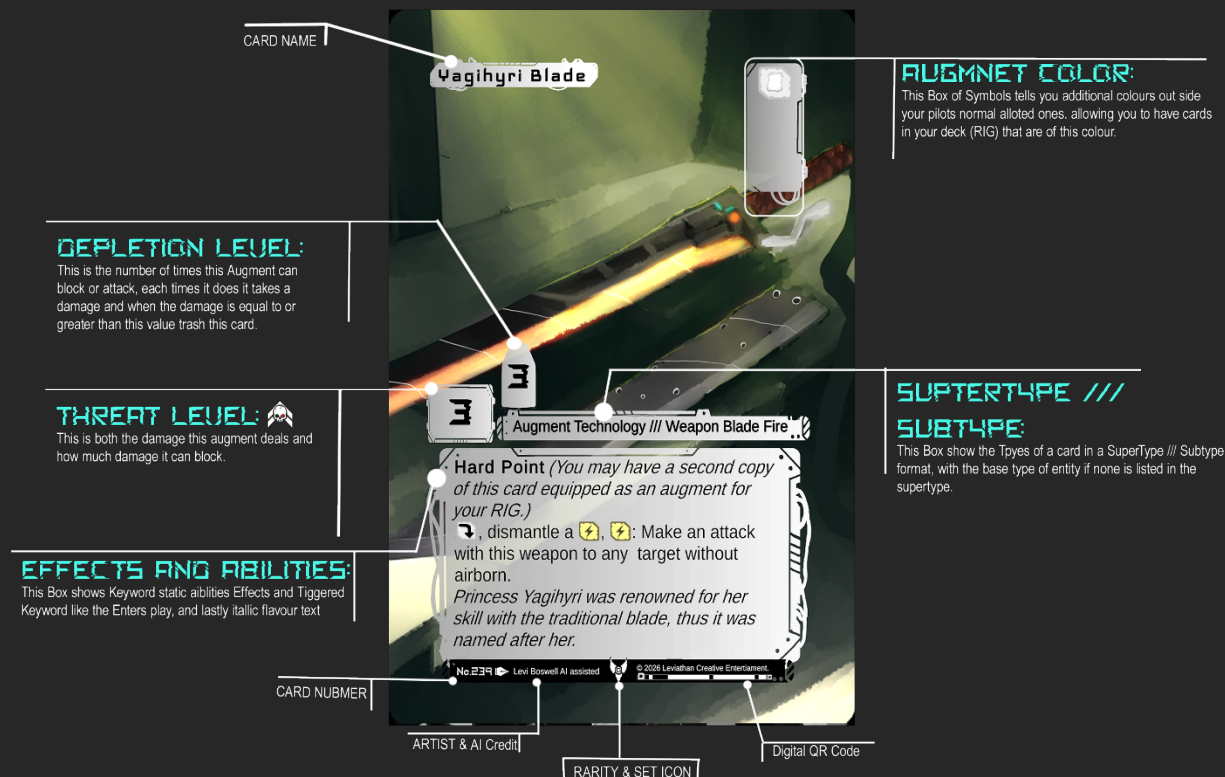

RARITY & SET ICON

Digital QR Code

STARTING RESOURCES:
This Box of Symbols Tells you how many Resources you start with already in your stock pile along with how much life points and your starting hand size.

SUPERTYPE /// SUBTYPE:
This Box show the Types of a card in a SuperType /// Subtype format, with the base type of entity if none is listed in the supertype.

CARD TYPES

Each non-resource card is called an **Asset** and has a base type either **Entity** or **Cyberspell**, along with an assortment of Supertypes and subtypes. If a card does not have the base type of *Cyberspell written in the supertype text*, it has the base type of Entity even if it is not written on the card.

A Cards Type is in the Types Box in the center of the Card. There Are the Following Supertypes which effect what a card does along with it its corresponding Base Type surrounded by []. Many cards also have subtypes which can affect what the card does as well.

! Important ! : Whenever an ability effect or text uses the word **this**, it always refers to the card it is printed on regardless of context.

--- BASE TYPES ---

CYBERSPELL: When you play this card with this type it goes to the discard pile after its effect is resolved or is overwritten.

ENTITY: When you play this card with this type it goes to the battlefield if time counters are not used to play it (*it would go to the stockpile with time counters used to play it*), after its effects resolve. If it is overwritten it goes to the discard pile.

---- SUPER TYPES ----

PILOT [Entity]: Your Pilot is the center of Attention; commanding drones, mechs, hacks, spells, and other effects from your deck in the pilot zone, you can also have them join the heat of battle if you so choose and show off why this Pilot you chose.

The Pilot is a Unit that starts in your pilot Zone and can be played from that zone by paying it's invoke cost. In addition to your Pilots Invoke cost your Pilots invoke cost also determines the color type of cards you can put into your deck combined with your augments. (*see Deck building for more details*)

UNIT [Entity]: Units can be call ins for your pilot as backup which can range from drone's, turrets, tanks, and even spacecraft, to help eliminate your opponent tactfully or with overwhelming force.

To play a Unit, pay is invoke cost and place it into the lock and see if your opponent overwrites it with a *Quick Hack* if not then it goes directly to the *Battlefield* if you chose not to use *time* as part of it's cost (*see time counters for details on how time resource works*) Units cannot attack the turn they are played.

PROGRAM [Entity]: Are a type of card that tend to be synergistic and stay in play when played and have a variety of effects and abilities.

TECHNOLOGY [Entity]: Are a type of card that tends to be counter play pieces or support like in nature and stay in play when played and have a variety of effects and abilities.

AUGMENT [Entity]: Are pieces of equipment or Cybernetic enhancements your pilots uses in battle to augment your game plan and strategy, they start the game on the battlefield and are limited based on the number of cards in your deck. You cannot have two of the same named augments as part of your deck.

PROTOTYPE [RARE]: Are prototype weapons spells and equipment and are often rare to find in lore. A card with this type is restricted to only having a single copy in your deck (*RIG*).

RESOURCE [Entity]: Are resource tokens that you can use to play (*invoke*) cards (*assets*) from different zones of play. Whenever a card says to "gain" a resource creates

a token of that color specified and put it into your stockpile readied (*90 degrees vertical*). You can use resources as soon as they enter play, no need to wait like a unit does.

TOKEN [Entity]: Are usually created by some effect and do not go to the discard pile when defeated or trashed. You may use your own tokens so long as it is clear what token they are to represent, and easy to distinguish if they are expended or not.

---- SUB TYPES ----

PROCESS [Cyberspell]: This Cyberspell can be played any time in your main phase. They represent a combination of magic and technology. These represent complex programs or scripts that take significant time to invoke in battle.

STRIKE [Cyberspell]: This Cyberspell can be played any time in your main phase, and counts as making an attack, when you play this card choose a target for its  damage. Any additional effects it has also target the same target unless the card says otherwise. These often tend to be special moves or magic and or other variety of attacks or prowess your pilot can do in the spur of the moment.

QUICK HACK [Cyberspell]: This Cyberspell can be played any time you can play a process, you may also play this card at a particular time at the end of each turn and during an attack, Or when there is a card in the lock, or an effect not controlled by you resolves and the lock becomes empty. (see Using the Lock for details) This cyberspell represents the fasted scripts you can invoke and disrupt your opponent with or protect yourself.

TIMING TRIGGERS & KEYWORDS

Some cards may include highlighted words or have keywords abilities.

All Abilities except for the EFFECT tag, and ACTIVATED abilities are displayed as tags on a card, ability tag is special text keywords are highlighted in black. There are two types of tags STATIC and TRIGGERED. STATIC tags mean the ability is always in effect while it is in play, and TRIGGERED abilities trigger when a particular condition is met. When two triggers are side by side both are in effect as with 'and' relationship.

Some tag conditions may be altered, if they are the condition will always be printed first then followed by a comma and then the effect when the condition is met like the following ignoring the brackets [condition], [effect].

ATOMIC Abilities with this tag trigger and or are active even while there are time counters on it.

ENTERS This ability triggers when this card enters play for the first time, either the battlefield or the stockpile and this ability always has the **ATOMIC** tag.

ENTERS **BATTLEFIELD** This ability triggers when the card Enters the battlefield for the first time

ENTERS **STOCKPILE** This ability triggers when the card Enters the stockpile for the first time

ATTACK This ability triggers on a card when you make an attack with that card.

END This ability triggers on a card at the end of your turn.

START This ability triggers on a card at the start of your turn.

INVOKE This ability triggers when you play the card this tag is printed on, but before the card goes to the lock and will always resolve as soon as it is triggered.

IF This ability triggers when a condition is met, formatted as ignoring the brackets [condition], [effect].

STATIC This ability is always active while the card is in play.

EFFECT This ability triggers when the card played resolves. Non activatable abilities without any tag automatically have this one. *Note: effects are also referenced as what an ability does.*

DEFEATED This Ability triggers when the unit it is printed on is defeated, meaning put into the trashyard from play.

---- ACTIVATED ABILITIES ----

Activated are abilities that are formatted such as ignoring the brackets [cost 1, cost 2, etc.]: [effect]. Unless they say otherwise, they can be activated anytime you can play a quick hack, if you do add it to your queue of effects if the lock is full, only when you put an effect into the lock is when you must choose your legal targets if possible, if no target is found the ability does nothing. To activate an activated ability pays its cost written on the card. Its effect then goes to the lock and resolves.

Example: the activated ability,"   1 : Draw a card." Means to expend the card the activated ability is printed on then pay 1 yellow unit of power and 1 of any color of your choice to add the effect to the lock of drawing a card after which it will resolve.

 This is the **Expend** ability and symbol, it means to turn a card in play from vertical 90 degrees to horizontal 90 degrees, if this is printed on a unit it cannot be active the turn the unit enters play unless it has **blitz**. *Note: to ready a entity is the opposite effect of this ability, a readied entity is vertical 90 degrees.*

 This is the **Recycle** ability and symbol, it allows you to discard this card from hand to gain an effect at any time you can play a quick hack except when the lock is full.

 This is the **Trash** ability and symbol, it can only be activated while the cards its printed on is on the battlefield, and to do so as part of a cost to put the card it's printed on into the discard pile (*trashyard*).

 This is the **Dismantle** ability and symbol, it can be activated while play and to do so as part of a cost is to put the cards its printed on into the dismantled zone.

---- KEYWORD ABILITIES ----

Keyword abilities are STATIC abilities and can be found on many of the cards you will play, almost all the time there ability text is displayed on the card, if not here is the full list.

! Important ! : Multiple instances of the same keyword on one entity do not stack unless that keyword has a numerical value; in that case, they add together. Any keyword with X is a numerical value.

AIRBORNE (*only assets with Airborne or Long range can attack this entity.*)

BLITZ (*This Entity can attack the turn it enters the battlefield.*)

BLOCK X (*When you block with a unit, augment, or cyberspell to reduce the damage an asset would deal, it is reduced by an additional X.*)

CORROSIVE BILE (*Whenever this entity deals damage to a unit, destroy that unit.*)

DEGRADE X (*The affected player puts the top X cards of their RIG into their trashyard. When you are the affected player, put the top X cards of your RIG into your trashyard. When card text says a player degrades X, that player is the affected player, if no player is stated that player is you.*)

DURABLE X (*This entity can take X damage more than their  rating before being defeated.*)

PREEMPTIVE STRIKE (*When this entity deals damage in a fight, it deals damage first, unless the opposing entity in that fight also has Preemptive Strike.*)

HARDEND X (*Whenever this entity takes damage, reduce that damage by X.*)

HARD POINT (You may have a second copy of this card equipped as an augment for your RIG.)

INSATIABLE HUNGER (Whenever a Unit with this keyword attacks, if the defending player controls a Unit, that attack must target a Unit that player controls.)

INVULNERABLE (This entity cannot be dismantled, trashed, or destroyed by effects that say to trash, dismantle, or destroy. Players cannot choose it as a valid target for those effects/costs.)

LETHAL X (Whenever this unit, cyberspell, or augment deals damage it deals X additional damage.)

LONG RANGE (This asset can attack units with Airborne.)

PEER X (Look at the top X cards of your RIG, you may choose any of them and put those into your trashyard, then put the rest back on top of your RIG in any order.)

PIERCE (Any excess damage this asset deals to its target is redirected to the target's controller.)

Deprecated RADAR (Whenever a Unit an opponent controls attacks, if it is the first attack in the main phase, you may redirect that attack to target a Unit you control instead.)

RECURSIVE (You may invoke this asset from your trashyard by paying its invoke cost, if you do, allocate the top card of you RIG face down to the card being invoked, then the next time this asset would go to the trashyard, dismantle it and the face down card instead of putting it back into the trashyard.)

REFURBISHED (Dismantle any number of cards from your trashyard; for each card dismantled this way, that pays for 1 of this card's costs.)

SPIRIT LINK (Damage this asset deals is gained as life by its controller.)

STALWART (When this entity attacks, it does not expend as part of the attack.)

STATIONARY (This entity cannot attack.)

STEALTH X (As an additional cost to target or attack this entity with cyberspells or abilities, the player taking that action must pay X for each cyberspell, ability, or attack, where X is the printed cost as shown on the card. If you do not pay the additional cost because of targeting this entity with the attack, ability, or cyberspell, it does nothing.)

STURDY (This entity cannot be destroyed by effects that say "destroy.")

SURGE (This card can be invoked any time a Quick Hack can be invoked.)

TAUNT (When opponents Make an attack, triggers, or activates an ability, it must target this entity if able. If there are multiple units with taunt, then the attacker may choose which one to target.)

WEAKEND X (Whenever this asset deals damage it deals X less damage.)

THE LOCK & TIME COUNTERS

---- THE LOCK ----

The Lock is a special zone where only one effect / card can be at a time. Every time you play (*invoke*) a card not using time counters or activate or trigger an ability it goes to the lock before resolving it.

The Lock Does 4 things

1. Determine timing
2. Determine who is the active and non-active player
3. Determine who can overwrite an asset with a quick hack.
4. Determine when an ability or asset resolves their effect.

To do so All effects, ability, and cards all use the lock. It is like an imaginary zone before effects are played and can only ever have one effect in the lock at a time. Depending on who controls the active effect in the lock determines who is the active non active player.

The active player at the start of each turn is always whoever turn it is. The active player is allowed to take game actions until an ability or asset is added to the lock. Then whoever controls that asset or ability in the lock becomes the non-active player and your opponent becomes the active player. (*If two abilities trigger at the same time the active player chooses one of theirs to add first*)

There are two Scenarios depending on whether the effect in the lock is a asset (*a physical card*) or an ability generated by a card in play or in hand or another zone.

Note: the active player is the only one able to take actions.

Scenario 1 the asset and quick hacks

When the active player adds an asset or effect to the lock they become the non-active player, and each player adds their ability triggers to their queue of effects when

the lock is full. The now active player may choose to invoke (*play*) play their own quick hack and overwrite the asset in the lock, preventing the one in the lock from resolving and going to the discard pile (*trashyard*).

Who ever is the non-active player is the player who controls the asset or effect in the lock and the active player is the one who does not.

The active player may choose to play a quick hack of their own or let the asset in the lock resolve. If they do its passes back who is the active player, recalculating who has a asset of effect in the lock, if they do not they become the non active player and the asset in the lock resolves, giving your opponent a free lock and active player, if the now active player decides not to do anything the active player becomes the person who's turn it is, and the turn continues as normal.

If the lock is empty but the players have abilities in their queues move to scenario 2.

Scenario 2 ability effects and the queue

Following the same rules as scenario 1, the only difference is the turn does not continue (*who ever turn it is gets to be the active player*) until all players queues are empty. Second, effects cannot be overwritten, only physical cards that are player (invoked) can be over written.

Lastly there are 3 abilities you can do while an effect is in the lock.

1. Pay costs (using resources abilities do not use the lock) but still have the timing restriction of a quick hack, meaning you still need to be the active player.
2. Allocate a resource to a unit you control. This is also quick hack speed, but you can only do so if you control no units that have expended resources allocated to them. Each resource allocated to a unit gives it a +1 🛡️ rating. To allocate a recourse expended it and choose a target. This ability does not use the lock and thus happens right away.
3. Activating an activated ability and adding it to your queue.
4. Blocking an attack.

---- TIME COUNTERS ----

Time counters play a role in what way you would like to interact with the lock; in the fact that you can reduce the cost of a card's invoke cost by 1 for each counter you will place on it after you play it. You can only reduce Grey numbered value costs this way. When you do instead of putting it into the lock you ignore the lock completely protecting your asset and place it in your stockpile with the number of time counters you used to

reduce its cost by. However, you do not get any of the card's effects right away; as cards with time counters on them have no abilities. At the start of each of your turns you may remove 1 counter from each card you have in play with time counters on it; when the last time counter is removed from a card in your stockpile you may resolve any effects it has by adding those effects to the lock/queue but not the card itself; you move the card to the battlefield if it's an entity, or to the discard pile if it's a cyberspell. You may have up to 3 cards in your stockpile with time counters on them at any given time. Cards with time counters on them in your stockpile cannot be the target of cyberspells or abilities.

HOW TO PLAY

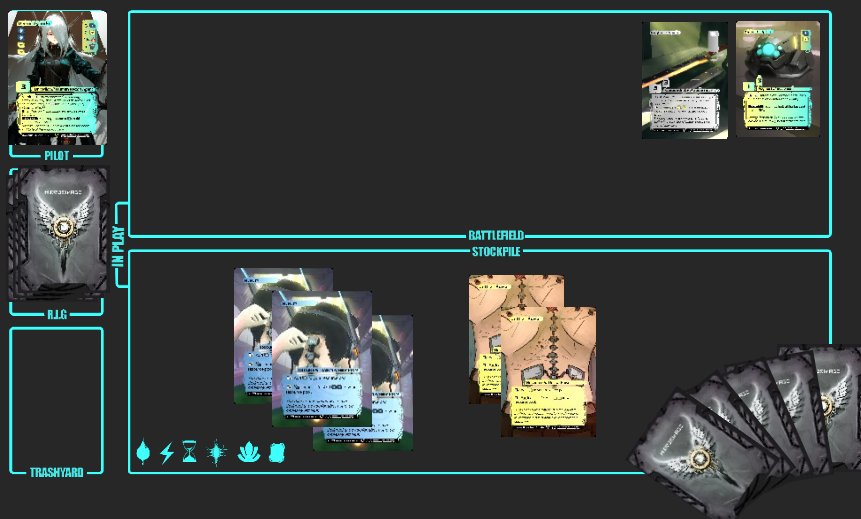

---- SETTING UP ----

It is recommended if it's your first time to use a premade starter deck, it has all you need to play.

- A pilot
- 2 augments
- Medium weight RIG (*deck*) of 40 cards with not more than 3 copies of a named card.
- D20 health tracker
- 5 red damage dice
- 5 green time counter dice
- Resource tokens

First place your pilot in the pilot zone. Then shuffle your deck and place it in the RIG zone, and then place your augments on the battlefield readied, and lastly grab the allotted starting resource tokens noted on your pilot and place them in your stockpile readied (*vertical 90 degrees*) set your life total and draw a hand of cards in the same fashion.

Once all players have done this, determine who goes first randomly, the winner gets to decide if they want the first turn. A setup demo using the blue, yellow starter is below:

Once the players know who is going first, they may look at their hand of cards. Each Player has the chance to mulligan unwanted cards from their opening hand; this only happens once. The player going first has the option to mulligan their hand first. To mulligan the player chooses any number of cards from their hand and puts them on the bottom of their deck (*RIG*) and then draws that many cards from the top of their deck (*RIG*). Once all players have made their choice to mulligan or not the player going first may start the first turn of the game. Once the game starts there is no maximum hand size.

---- TURN PHASES ----

In this Game there are three phases the maintenance (*start of the turn*), main phase, and end of turn phase. You do them in order when you take a turn. If you want to play a more challenging game mode include the steps with the **[Hardcore]** tag.

MAINTENANCE PHASE

1. Ready all entities you control
2. Remove a time counter from each card you control in play and resolve any effect triggered when the last time counter was removed from a card in your stockpile.
3. **[Hardcore]** Dismantle a resource you control.
4. Draw a card, except for the player going first for the first turn of the game.
5. **[Hardcore]** Draw an additional card.

MAIN PHASE

You may play (*invoke*) cards, activate abilities, and make attacks, allocate a resource to a unit you control, or Accumulate Resources, in any order.

To make an **attack**:

1. Choose Unit(s) that did not enter play this turn, units with blitz, playing a cyberspell strike card, or activating an augment that says it makes an attack. When making an attack with multiple units the group of units you attack with are considered a single attack and all must have the same attack target, but each attacker is still treated separately for blocking purposes.
2. Expend the chosen Unit(s) and declare an attack target (*another Unit or an opponent*) trigger **ATTACK** abilities of attacking Unit.
3. Block incoming damage you may in any order:
 - Expend unit(s) and redirect an attacker to the expended unit instead, you can do this even if the unit has entered play this turn, when there are multiple units as part of a single attack you may only redirect one of them. (*attack redirected in this way do not trigger effects like stealth, etc.*)
 - Discard any number of cards in hand with a  rating add them together and reduce the damage by the total amount from an attacker of your choice.
 - Expend any number of augments you control and choose an attacker for each and reduce the incoming damage by the augments  rating and add a depletion counter to that augment.
3. Before damage is dealt, players may invoke Quick Hacks or activate abilities, starting with the active player, until no one adds more effects.
5. Deal pre-emptive strike damage equal to your  + modifiers, value.
6. Deal damage if you already did not deal Pre-emptive Strike damage equal to your  + modifiers, value to the target of your attack. If the target is readied, it deals damage equal to its  + modifiers, value damage back to the attacker. Damage dealt this way is done simultaneously.

If a Unit has 0 or less or if the amount of damage is greater than or equal to the 🦾 rating, it is defeated (*with the only exception being the **durable** key word*) and trigger the **DEFEATED** tag if it had one, and other triggered abilities that care about being defeated. A defeated unit goes to the trashyard. (*discard pile*)

7. Any damage that was directed at a player and was not blocked or redirected is dealt in the loss of life to that player, then the attack ends.

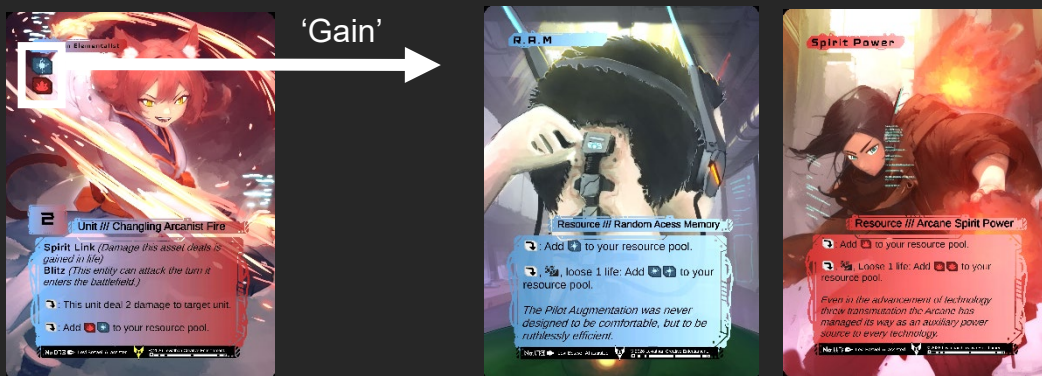

END TURN PHASE

1. players may invoke Quick Hacks or activate abilities, starting with the active player, until no one adds more effects.
2. Loose any unspent resources in your resource pool (*not stockpile*).

--- ACCUMULATE RESOURCES ---

To Accumulate Resources, you can do so only once per turn and only on your turn, to do so choose a card in hand reveal it and then you ‘gain’ (*grab*) up to three resource tokens from its listed invoke cost written on the card ignoring the grey numbered costs and add them to your stockpile readied. Then put the card you revealed on the bottom of your deck (*RIG*). This action does not use the lock.

Example:

--- HOW TO ALLOCATE A RESOURCE TO A UNIT ---

This ability can be used any time a quick hack can including 🛡️ when the lock is full, but you can only do so if you control no units that have an expended resource already allocated to them. Each resource allocated to a unit will give that unit a +1 rating for each resource allocated to it. To allocate a resource expended it and choose a target. This ability does not use the lock and thus happens right away.

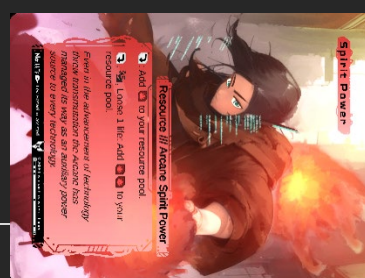

---- HOW TO PLAY (INVOKE) A CARD ----

Each Card Has a Invoke Cost which means it can be played, a card without an invoke cost on the upper left hand on the card cannot be played. To Pay for the cost you must have resources required in your resource pool, an imaginary area when a card says to 'add' a resource of the colour you need goes and stays they're until the end of the turn. Most often your resource tokens have two abilities that 'add' a 1 or 2 resources of their colour to your pool so you can spend them on the cost to play a card.

Let's look at this example, I want to play the Flame kin elemental on the left. And need a RAM (blue) and spirit power (red) in my pool to invoke the card. I have already in my stockpile a RAM and Spirit Power readied. And they each have abilities the first one adds a resource to my resource pool of it respective color when I expend the resource card as its cost. And the second I loose 1 life and dismantle the resource and add 2 of its respective color.

Because I have what I need I'll expend both the RAM and Spirit Power Resources which adds 🟦🔴 of the respective color when I expend them like the image below.

Once you have payed the cost and if the card say to target then you must have legal targets before you invoke the asset, or you cannot play it, if you do reveal the card you intend on playing it goes to the lock and declare it's legal targets, then trigger any **INVOKE** tags printed on the card and resolve it right away. If it does not get overwritten by an opponent's quick while it's in the lock the card resolves, first by putting the card in its respective zone for entities, the zone is the battlefield, for cyberspells it's the trashyard (*discard pile*) then resolve its effects (**EFFECT** see this tag for details). Then any other ability triggers like **ENTERS** tag. The card has completed being played. If your cards invoke cost has   ... etc. you can use any colour of resource in your pool to pay for 1 of the cost it requires, and or reduce that cost by  foreach time counter, see timing the lock and time counters for more details.

You now have everything you need to play, so let's begin the final bit and talk about making your own RIG.

DECK BUILDING

Your R.I.G is your deck of cards for all purpose of the word but it also includes your pilot and augments, there are three types of RIGs light-weight, medium-weight heavy-weight.

Depending on your RIGs choice determine the minimum number of cards in your deck and the number of augments you can equip.

R.I.G (deck)	Capacity (#cards)	Equip slots (#augments)
Light weight	30-39	1
Medium weight	40-59	2
Heavy weight	60-70	3

Once chosen, their a few rules to keep in mind when building a deck.

1. Pilots cannot be part of the deck's capacity, and you have a limit to a single pilot card.
2. Any non pilot card can have up to three copies of with the same name as part of your deck's capacity

3. You cannot equip two augments with the same name
4. Any card with the **prototype** supertype is limited to a single card in your deck's capacity.
5. You cannot put cards in your deck that are not supported by your pilots and augments' colour combination.

--- YOUR DECKS COLOR COMBINATION ---

Your Pilots **Invoke Cost** + your chosen Augments **Augment Color** determine the colour combination of your deck. (see reading your cards for image) there are two requirements you must meet to put a card into your deck.

1. Each invoke cost of a card you want to include in your deck's capacity must have the same or less colored symbols than the combined colored symbols of your pilots' invoke cost and augments' augment color.
2. The total invokes cost of the card you want to include in your deck's capacity is less than the total invoke cost in relation to the coloured symbols between your augments and pilot. Where each coloured symbol on your pilot and augment counts as 2 toward the total invoke cost.

Note: grey number valued symbols' number are disregarded but still count for 2 for colourless and steel.  total invoke costs.

For this starter deck you have the total color combination of:

This allows you to play any card with up to 3 blue and 3 yellow and 1 steel or colorless costs. With a total invoke cost of 2 for colorless and steel costs, 6 for blue, 6 for yellow and 12 for

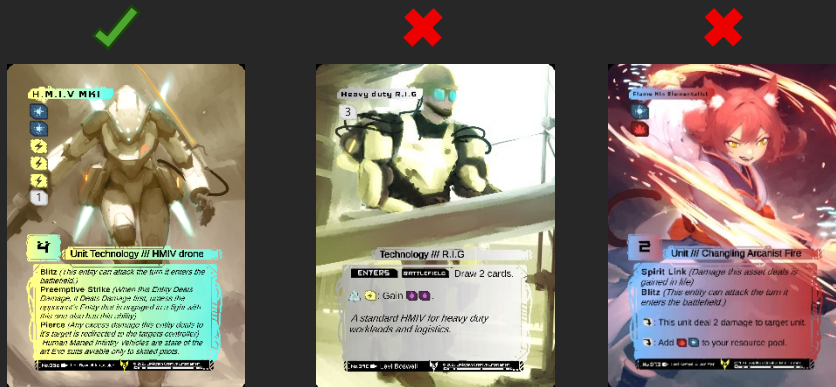

blue and yellow.

In the following examples below you can see how the system works. Grey colorless symbols do not count as steel if there are another colors involved, they just count toward the total invoke cost, which is why the HMIV MK IV unit is good to put into the deck we can have up to 12 total invoke cost and also meet the required symbols of 2 blue and 3 yellow (numbered grey symbols only count toward total invoke cost).

While we do have up to 2 invoke cost to invoke Steel and colorless cards for a second example with the card Heavy duty RIG; because this card is worth a total invoke cost of

3 and has no color, we need one more steel symbol in our suite or our pilot needs a grey numbered symbol. That is why the card Heavy duty RIG cannot be part of the deck's capacity.

Lastly, we have the blue required for the card Flame Kin elementalist but we lack the red one even though our total invoke cost, because our 3 blue, is 6 which is enough for the cards total invoke cost of 2. But because we lack the red symbol this card also cannot be included in the deck's capacity.

With that concludes deck building.

Some guide lines though to make a functional deck, how many cards of a color determines how likely you will draw that card especially if you plan on building a deck out side your pilots starting resources, you will likely need to accumulate a card of its color before you can play other cards in that color so be careful.

Secondly, while your decks will have less variance for lighter weight RIGs you will also be more limited on either the variety of assets you can put in the deck or the total power of the cards. As many of the higher cost cards are quite powerful.

Lastly there is no sideboard in this game what you decide to put into the deck will need to include your potential sideboard as part of building the deck.

May you find thorough enjoyment in the game, whether it be crafting the perfect RIG or the heat of battle, or self-creative expression with your resources pilot and augments. Good luck and have fun!

"He forgot to mention HAI's man I 'am kind of a big deal, being attached to a pilot and all, ... ya .. oh, right, for the next batch.. got it, well then, log complete for the new pilot I guess, until we meet again on the field of battle, signing off..." -Svn
